Does this UI make sense if you need to sort through 50-100 videos?
Maybe it's better to view each video in a similar format to the previous screen. A preview function with spacebar would be pretty awesome.

Is a gradient here at all beneficial? Want you to not have to feel like you have a ton of videos to keep looking at. You can focus on the videos row by row.

Video Cluster Title, Geographic Location ▾

Click on the arrow to read more about the cluster.
This would be whatever information/metadata (?)
that came with the cluster.

Is it easier to have it say "4x4" or 3x3" or "2x2" here for number of videos to show?

Next Cluster >

If you wanted to - we could view videos in these tiny thumbnails. They would play on hover just like in OnReel News. We could make a filter so that you could adjust the thumbnail size from small, medium to large!

A highlight will appear around the videos that you want to download. Double click to trigger. Was originally going to make the button say download but since these are only the videos you selected from this ONE cluster and you have more to go through you should set it to a kind of "queue for download" or "collection for download" actua only download from the main screen you originally saw (white background).

Add to Collection
